----- Indy is a set of libraries intended to be used in building applications for the.NET

platform. Indy's promise is to integrate a set of libraries that each do a particular job. Indy consists of

six components: [?] IndyCore

IndyCore is the core of Indy. It is our general purpose stuff and is included with Indy. [?] IndyCommon

IndyCommon is the common place where common Indy stuff,

including types, events and other useful things live. [?] IndySystem

IndySystem is a set of useful objects to work with indycore. [?]

IndyWinTypes IndyWinTypes provides a type library for working

with a managed.NET based language using.NET "any datatype" rules. [?] IndyData IndyData is a set of classes that makes working with indycore, IndyCommon and IndySystem very easy. [?] IndyXML IndyXML is a set of classes and types that are used to read and write XML. IndyXML is used to help build XML documents for web services, XSLT transformations or any other XML processing. IndyData supports processing many data types natively, but IndyXML deals specifically with xml.

IndyDataset deals specifically with saving data. IndyData and IndyDataset both use IndyXML. This means that writing programs to manipulate data using Indy is extremely easy. IndyXML handles both reading and writing of the xml format. IndyXML is very useful for basic xml processing and editing. It is ideal for web services where you just want to deal with xml. The IndyCore, IndyCommon, IndySystem, IndyWinTypes, IndyData and IndyXML components are contained in DLL

files that make them very easy to use. And the component itself is open source and freely available.

Indy is an open source project that is a fully functional, standards-based e-mail client and powerful

and intuitive mail client, web browser, and news client. Indy continues to be under development and is being actively enhanced. Our aim is to create an open source mail client that can support mail standards while maintaining the fastest performance

IndyNdis
IndyNdis is a BSD licensed telecommunications application. It is a composite program made up of multiple parts: * Indyhttpd * IndyMail * IndyMQTT * IndyNetwork

IndyNdis is designed to be used as an example of building

a telecommunications application. It illustrates the idea of building an application from components. The focus of IndyNdis is to build the capability of independent components into IndyNet and to inter-relate the Indy services using the QTT architecture. By utilising IndyHTTPd and IndyMQTT, as IndyNdis components IndyNdis is able to direct all of its traffic through IndyHTTPd and hence through the popular IndyHTTPd web proxy. Using the IndyMessage framework, indynetwp is able to

interlink the components of IndyNet to control how messages are delivered to IndyNdis. IndyNdis is designed to support an extensible architecture allowing each component to develop a purpose built IndySourceCode application. Searching through code is difficult, and searching a code base for a particular function often requires significant time. IndySourceCode makes it easy to search for code in a code base.

IndySourceCode is a single front end program, which searches through a code base and displays the results in a user-friendly manner. IndySourceCode uses a simple web browser and does not require download or installation of any client. Using a "Side-by-Side" presentation of the source code, you can execute the source in either normal or debug mode. The source is searched using regular expressions, which are able to match only small parts of a large source code file. IndySourceCode

also checks for exact matches, which are not case sensitive. A range of search parameters can also be used to provide the user with a more focused search.
