1. **Establish a Camera Object.** It's nice to keep things simple. Follow these steps to create a rectangular camera: 1. **On the Layers panel, click the New Layer icon and enter a name for the layer such as "Camera."** The New Layer icon is in the bottom left of the Layers panel. 2. **Click in the Canvas and drag out a rectangle from the bottom left to the top right.** The rectangle is set to Snap to Grid; when you release the mouse button (if it's not already), a square is made. The dimensions of the layer are constrained by the size of the canvas. 3. **Click the New Layer icon again, enter a name for the layer such as "Camera Background," and drag the Rectangle tool out of the Camera layer and into the new layer.** 4. **Move the rectangle to the bottom left of the Canvas and increase the size of the rectangle until it covers the entire canvas.** The Rectangle tool's Width and Height fields work just like those of the Pen tool described in Book II Chapter 2. The spacing of the individual pixels is measured in the Pixels Per Inch field of the Size/Quality Options panel (see Figure 3-1). 5. **Change the Fill color for the layer to black.** Because the Canvas is black, the layer appears transparent. 6. **Repeat the previous three steps for another layer such as "Camera Foreground" to create the background of your photo.** **Figure 3-1:** The Canvas can be reset to black or any color with the Fill tool. | --- | --- For a more detailed look at creating basic layers, see Chapter 9 in Book II. * With the Background and Foreground layers active, you can control their opacity. In this case, set the Background opacity to 70 percent to see the background clearly.

There, they find a strange apparition - but is it a hallucination, or something more sinister? Tunable high-power coherent, single-frequency laser radiation via wavelength-selective crosstalk in multimode fiber. We demonstrate a tunable coherent, single-frequency laser at a wavelength of 1.3 microm via crosstalk in multimode fiber. The crosstalk extends the coherent-generation wavelength range of a broadband master laser from 1.06 to 1.68 microm. At 1.3 microm, a single-frequency, 1-W laser radiation is achieved with a linewidth of 4 kHz. Thus, the frequency tunability and crosstalk in multimode fiber provide a high-power source of coherent, continuous-wave, single-frequency radiation tunable in a wavelength range from 1.06 to 1.68 microm. Q: difference between an object property and its getter method in Javascript if I have an object with an attribute / property named x, and I have a function named x() and some value x, I can actually access them in two different ways: obj.x obj.x() what is the difference between the two, from a language perspective? A: The property refers to that thing within the object. The getter is a method of accessing the internal thing. This is what the MDN docs have to say about properties: A property is an association between a field and a value in an object. In JavaScript, properties allow us to associate a name to a value. and for getters: A getter is a function that, when invoked, will return the current value of a property. A:

At this point the info for English, Chinese, French, and Spanish is all done: With that information in place, we can run Update Schema against the Latin and Greek languages to make sure the correct gender rules are reflected. Switch to MySQL GUI – use the menu option under My Connections | Connections In the table named SQL-Admin, right click the instance named MYSQL_TEST_DB. Select the option to Update Schema Select the tab called Table Comments Enter the following line into the empty field below the heading CREATE TABLE: CREATE TABLE TEST_TABLE (TITLE VARCHAR(20), CONTENT TEXT, PERFORMED BOOLEAN, DATE_ENTERED DATETIME NOT NULL, DATE_COMMENTED DATETIME NOT NULL, PRIMARY KEY(TITLE)); Switch to phpMyAdmin Under the Database you should see the Database we created in SQL-Admin above. Go to Tables Expand Tables Navigate to Test_Table.php.db Add the Description field Updating the Gender Feature Again, this section can be broken into two parts – the English language code and the Latin and Greek languages. Step One: English Language We can start with the English language because it is the smallest – it will only add one field to the table. Select the table containing the gender data. Click Edit SQL. The code will appear in the Textbox. To find the code, we need to look at the schema information. We can see from the Description column that we can add a new field by running the following CREATE TABLE

statement: CREATE TABLE kiki.test_table (TITLE VARCHAR(20), CONTENT TEXT, DATE_ENTERED DATETIME NOT NULL, DATE_COMMENTED DATETIME NOT NULL, gender_code INTEGER UNSIGNED NOT NULL, DESCRIPTION VARCHAR(24) GENERATED ALWAYS AS (if(gender_code = 0, concat('he',sex),concat('she',sex))) VIRTUAL, PRIMARY KEY(TITLE));
