Using a Digital Camera Your digital camera can be a useful tool for many photo jobs. Although you can download your camera's images to your hard drive as you shoot, it's better to use the camera's immediate ability to adjust the light, color, and exposure settings. Here are several tips for using your camera for art projects: * Consider the `_auto mode,_` which determines the exposure automatically and lets you focus instead. As a general rule, use this setting when taking portraits and when you want to keep the rest of the image under- or overexposed. * Use the `_program mode,_` a set of parameters that gives you more control than the auto mode and makes it easier to change the characteristics of an image. * Consider making a photo collage. You can use images that you've already downloaded to your camera and collage them on a computer, or you can even use your camera to do the collaging. * With Photoshop Elements or other programs that support it, the images of a sequence can be combined into one series. This is called `_montage_`, and you can see examples of this in Figure 6-5 and Figure 6-6. It's a great way to make images last longer. Figure 6-5: To make a collage using images from a sequence, first use Photoshop Elements to select the files you want in the folder. Then click Sequence ► Create Collection from Selection, shown here. Figure 6-6: This image is a montage of five images. You can use any image-editing program to combine the images. ## Taking Digital Photos If your camera has a flash, you can shoot ordinary or black-and-

In this tutorial, we will cover all the editing techniques you can do in Photoshop and combine a few of them to create professional-looking images. Before You Begin Firstly, we need to prepare our photos for editing. We will need to get rid of the background, add the right blend mode and use a black and white adjustment layer so we can see what we're doing better. 1. Remove the Background Open your image in Photoshop and select the Rectangular Marquee Tool from the Toolbar. Move the mouse cursor over the background to select it. Press the Ctrl/Cmd key and click twice to select both the background and the photo contents, then click 'OK' (or press Enter). With your photo selected, go to Select > Modify > Contract, and in the dialog box, choose Between Highlight and Shadow (you can also choose the 'Lighter Color' and 'Darker Color' options). Press OK. Note: This will result in the creation of a selection around the edges of your photo. You will also need to refine this selection using your tools of choice. Continue with removing the background with the following steps, and note that you may need to double-click when selecting the clipping mask tool to make it appear. Click the Create Clipping Mask icon in the layer panel (see picture below). Or, if you want to edit the background before removing it, click the background with the small green square, and then use the Brush tool or eraser to paint on it. 2. Add the Blend Mode Go to Layer > New Adjustment Layer > Curves. In the dialog box that appears, choose a blend mode that fits your image and then click OK. 3. Change the Black and White Points Go to Layer > New Adjustment Layer > Levels. In the dialog box that appears, start at the bottom and move up, making sure to maintain more than one black and white point in the image. Increase the contrast of the image as needed, and then start clipping the adjustment layer. This will create a new color area. Drag the new color area into a new adjustment layer

(see above), then continue adjusting the colors until you achieve the desired black and white values. Remember, you will need to continue this process if you want to make changes to the photo in the future. 05a79cecff
