Start by creating a new document, which works best if you create one that is 1,200 x 1,200 pixels. Create a file with a layer name that is similar to the image's name and make sure the document background is white. Once the new document has been created, you'll load a photograph into it. You'll want to make sure to import the image as a flattened file rather than a JPG file as JPGs do not support layers. You can flatten the image by clicking the flatten button that appears when you select an image

(shown below). The image needs to be flattened for one of Photoshop's layer features—click the "lock as a Smart Object" button on the Layers panel and make sure that the Layers panel is checked. Next, you'll need to convert the image to black and white. To do so, you'll need to select the Hue/Saturation command that is located next to the channel control on your keyboard. You can see an example of the Hue/Saturation command options in the image below. Next you'll adjust the color balance. You can use the Hue/Saturation command to adjust the Saturation

slider. Adjusting the Saturation will determine how much or how little the image looks like it was taken in color. The color balance tool's 'temperature' can be adjusted by using the temperature sliders, located near the Saturation slider, to adjust both the warmth and coolness (or color temperature) in the image. After the color balance is adjusted, you'll use the Curves tool to bring out areas of the image that were not as bright or as dark as the other parts. You'll use the Curves tool. Use the mouse pointer to drag the slider to adjust the brightness values. For example, you can drag the

middle or light blue part of the slider (shown below) to the left. This will decrease the brightness of the image, whereas dragging the gray area in the middle will increase the brightness, making the image brighter. Once you have brought the brightness in your image to a suitable level, the image will begin to look more like a photograph. To achieve this, use the Levels tool. The Levels tool is located on the left side of your image, as shown in the image below. There are three main settings you will adjust: The white point, which is the point where the image's white

Photoshop Elements is available for iOS and Android, Windows and Mac operating systems. Photoshop is one of the most powerful tools available. Management of type 2 diabetic patients with diabetic maculopathy by observation and treatment with ranibizumab. To evaluate the role of ranibizumab in the treatment of diabetic macular edema (DME). Observational prospective study. Fifty-four eyes of 27 type 2 diabetic patients with DME were analyzed. Exudative DME that was unresponsive to laser photocoagulation and anti-vascular endothelial growth factor (anti-VEGF) treatment was included.

Ranibizumab was administered by intravitreal injections. The patients were observed for 8 months for changes of visual acuity, central foveal thickness and leakage, recurrence or persistence of DME, and adverse effects. The mean age of the patients was $58.6 +/ - 12.7$ years (range, 34-82 years). At baseline, the logarithm of the minimum angle of resolution (logMAR) visual acuity was $0.56 +/ - 0.53$ (range, -0.18 to 1.70), and the mean central foveal thickness was $304.8 +/ - 93.6 \mu\text{m}$ (range, 169-451 μm). After 8 months of treatment, there was no change of

the logMAR visual acuity ($0.56 +/ - 0.60$, $p = 0.13$) and the central foveal thickness ($283.5 +/ - 97.2 \mu\text{m}$, $p = 0.02$). The cumulative probability of recurrence after 8 months of treatment was 50.0%, whereas the probability of recurrence after 24 months of treatment was 94.7%. The adverse effects were low-grade intraocular inflammation and iritis in 1 patient, and pan-uveitis in 1 patient, which resolved spontaneously. Six patients underwent pan-retinal photocoagulation before treatment and did not show recurrence or persistence of DME (logMAR visual

acuity, $0.60 +/ - 0.56$; central foveal thickness, $283.6 +/ - 117.8 \mu\text{m}$) or increased logMAR visual acuity and central foveal thickness during the treatment (logMAR visual acuity, $0.52 +/ - 0.42$; central foveal thickness, $259.8 +/ - 88.1 \mu\text{m}$). Ranibizumab is a promising treatment for eyes with DME that are not treated by photocoagulation and anti-VEGF treatment. It offers a good safety profile and is effective for both short- and long-term treatment. However

Is there any antidepressant drug which inhibits corticosterone-induced changes in delayed radial maze performance in rats? The present study was conducted to examine whether pretreatment with the antidepressant drugs imipramine, clomipramine, amitriptyline and trazodone affect corticosterone-induced effects on learning and memory in the delayed radial maze test in rats. All 5 drugs used at a dose of 12 mg/kg prevented the deleterious effect of corticosterone on learning and memory in the delayed radial

maze task. These results indicate that the drugs used possess a potential antidepressant activity and inhibit the corticosterone-induced impairments of learning and memory in rats. U.S. Pat. No. 6,220,980 to Schwarz discloses a protective device for firearm ammunition magazines of the type which employ a wire which is attached to the magazine to form a loop around the periphery of the magazine to keep the magazine from being ejected during fire. Specifically, a housing is provided for receiving an ammunition magazine and includes a wire structure which

wraps around the entire periphery of the magazine in a loop. The wire structure includes a wire which is secured to the housing by a plurality of threaded fasteners. The wire structure is formed of a relatively stiff but resilient, yet flexible material such as metal. When the ammunition magazine is subjected to sufficient tensile force on the wire structure, the strength of the material exceeds the tensile strength of the wire, causing the wire to fail and shear off the edges of the housing. The wire structure is only intended to be assembled to the housing once and

never intended to be disassembled from the housing. U.S. Pat. No. 6,212,472 to Vasquez discloses a plate-like locking device for a firearm magazine which is held within the magazine by a round wire band. A spring plate secures the band to the upper edges of the magazine and holds it in place against the sides of the housing. The band is tensioned against the upper edges of the magazine to fix the magazine in place. The band does not prevent movement of the magazine within the firearm. Nor does the band fix the magazine to the housing in a manner

to prevent removal of the magazine by an unauthorized user. U.S. Pat. No. 5,768,875 to Lecorne discloses a protective cover for a firearm magazine. The cover is in the form of a square block of hard plastic which snaps over a magazine and is held in place by friction.
