Evaluation of a regenerative and bioactive implant material in ovine maxillae. The effect of an implant material (anodic aluminosilicate glass) with one year of repassivation was studied in a sheep jaw model. Five sheep had the experimental implants inserted at both the right and left posterior maxillary sinus and a control group of five had their maxilla sinus cavities enucleated. The maxillae were recovered, sectioned and the specimens evaluated histologically, histomorphometrically and for mechanical strength using pull out and strain gauge testing. The implant surface showed regeneration of periimplant bone that was gradually invaded from both the sinus wall and adjacent alveolar bone. Histomorphometrically the area of periimplant bone was significantly greater in the control compared to the experimental sinus. However, the increase in bone area appeared to be of borderline significance. At the end of the

study the implant showed no signs of failure and retained adequate mechanical strength. The present invention relates to a gripping device for use in applying torque to a tool where the tool is easily and readily detachable from the gripping device, and the gripping device is easily movable on a work piece. A wide variety of devices have been developed to apply a rotational force to a tool and a hand tool, such as a socket wrench, is one example. Many times the socket wrench is detachably connected to the tool, such as a drive end of the socket wrench, which is then applied to a work piece. Typically, the socket wrench includes a ratchet mechanism having a set of teeth that engage with a pawl and mesh with the teeth of the drive end of the socket wrench. The tool drive end is angularly movable from a first or start position, where no torque is applied, to a second position
