Q: Tensorflow Accuracy is 0 I tried to trained a deep classifier on a small dataset with tf.Dataset and tf.contrib.learn. I'm using keras instead of Tensorflow 2 for experimental purpose. There is a dataset of 5 images, and each image has the color of red, blue, and green. I have 3 classes in which the colors belongs to. The dataset has only 5 records, but for simplicity I created a dataset of 100 records with only 2 classes. The 2 classes are even numbers and odd numbers. The data is sparse so what I did is simple, for each sample, I just turned all evens and odds into 1, and all differents into 0, and this is the data. It's easy to generate it with a simple for loop, but that was not the idea. Here is the code: import keras from keras.models import Sequential, Model import tensorflow as tf import numpy as np from tensorflow.keras import layers, losses, datasets X = np.zeros((200, 3)) Y = np.zeros((200, 2)) y = np.array(['0', '1']) def my_dataset_gen(batch_size=100, shuffle=False): for i in range(5): X_batch = np.ones((batch_size, 3)) Y_batch = y[i] if i%2 == 0: X_batch[y_batch==0] = 0 else: X_batch[y_batch==0] = 1 yield (X_batch, Y_batch) model = Sequential() model.add(layers.Conv2D(filters=64,

Q: How does a micro motor (with full speed control) move a few centimeters/millimeters/tens of millimeters? I would like to know how a micro motor/stepper motor/electromagnet will move such a small distance (micro/milli) like a few centimeters or a few millimeters. The stepper motor would be able to move the object horizontally and vertically. The most I can imagine in the horizontal direction would be "something" like a motor with very high torque speed and very fast acceleration, but without a gear. The acceleration might be so fast that it would be limited by the mass of the object. The vertical direction is a bit more complicated. I can only imagine a long rod, where a motor at the end moves it with a huge torque. That rod is then fixed in the end wall and would be made of some sort of non-magnetic material. This rod would accelerate the object towards the ceiling because of gravity. How would a micro motor (with high torque but very low speed) move such a small distance (micro/milli) like a few centimeters or a few millimeters? A: You need to look into the road movement system to see how such precision can be obtained with the mechanical elements used. Most likely, the motor would be used to rotate a worm and worm gear. The gear would drive a final drive and the final drive itself would be rigid and much lighter than its modern electric counterparts. The final drive would drive in the linear motion of the road or rail. The difficulty with precision moving these small distances would be to obtain the proper geometry of the motor and the worm which will require the mechanical precision that you did not speak about. There are still various techniques for machining gears out of thin aluminium and beryllium for this purpose. Q: Disable an HTML text input I have a text input (type="text") in a form. I want to disable it but I can't seem to do it.
