AutoCAD - a relatively new CAD application - is gaining popularity very fast. This is in contrast to the fact that other popular CAD applications, like AutoCAD LT, run on older operating systems. By using AutoCAD, you can now design 2D and 3D drawings more quickly than ever. You can edit your drawings using a mouse. You can create and edit 3D objects and entire 2D drawings using 2D geometry tools. You can also draw 2D sketches, 3D surfaces and 3D solid objects. It is also possible to create 3D models of products. Autodesk has made several upgrades to AutoCAD in recent years. For example, several updates have been made to the AutoCAD 2017 release: You can turn 2D and 3D layers on or off. You can now use tabs to arrange views and components and to add labels and fields. You can select all the components of a 2D or 3D drawing on one drawing tab. You can paint using a selection that you've created, or you can use a photo or digital image that you've added to the drawing. You can open multiple drawings in one tab. You can automatically save the current drawing as a draft or save it as a template. In this post, we'll take a look at the AutoCAD 2017 software and how to install and use it. AutoCAD 2017 Features AutoCAD 2017 offers several new features, including the following: The new AutoCAD 2017 mobile apps feature one-key 2D and 3D drawing tools. You can add layers, annotate drawings, create drawings for use with the 3D printer and generate 2D and 3D models. The mobile apps are available for iPad, iPhone and Android. You can now download and open a new drawing, either from scratch or from a .dwg (draft) file saved by another version of AutoCAD. You can set the workplane for a 2D or 3D drawing to a specific position on a 2D or 3D grid. You can use the AutoSnap feature to draw lines between two points. You can even do that

Metformin, a biguanide antihyperglycemic drug, is known to exert antiinflammatory and wound-healing effects in several experimental models. However, its clinical efficacy in wound healing remains unclear. This study investigated the effects of metformin on the healing process of acute dermal wounds in mice. Acute dermal wounds were induced on the dorsa of mice by using biopsy punches and were treated with topical vehicle, metformin (50 mg/kg body weight), or insulin (1 U/mL). The extent of wound healing was evaluated by an injury score and by the breaking strength of the wound margin. Epidermal regeneration was assessed by using the Karyopyknotic index and the cell proliferation index (Ki-67 immunoreactivity). The microvascular density and the expression of vascular endothelial growth factor were also evaluated. The magnitude of the wound contraction was significantly enhanced in metformin-treated mice. The breaking strength of the wounds in metformin-treated animals was significantly higher compared with the controls. Treatment with metformin significantly increased ca3bfb1094

Q: How can I use gRPC with ASP.NET Core I have a gRPC.Net Core server project. I can make.Net 4.6.1 calls from a.Net Core Console app in the same solution. However, I can't get it to work with a.Net Core 3.1.1 Console App. I can't find anything relevant in the project.json file. I have 2 instances of a server. Console app (works) Web app (works) Why can't I make.Net Core 3.1.1 call a gRPC service? A: There are a couple of things to note in this scenario. The.Net Core version of grpc-dotnet only supports.Net Core 3.0 or higher. If you want to call a gRPC service from your console app you can do so by using the Service Fabric client SDK. You'll need to do a little bit of work to make that work (MS docs), but it is possible. The problem with an ASP.NET Core App calling a gRPC service is that there is no gRPC host on.NET Core. You'd have to include one and make that behave as a gateway to the service. Not necessarily the answer you're looking for. Q: Can I send a personalized email (from a web app) to an account that is set to "hide email addresses"? I am creating a web app which allows students to set up class accounts for students to receive emails. There are two user roles "Student" and "Professor". I am able to send a standard email to a students' account successfully. What I need to do next is to send an email with a personalized message for a Professor's account. However, when I try and send a personalized email from a Professor's account, I receive the following error message: This account is configured to hide email addresses. The address you tried to send to is a list of one or more addresses that this account doesn't currently receive messages from. I can access this account if I don't send the email. I can see the message stating that an email is being sent successfully. I can also send emails from the Professors' account to the students. What I want to do is to send an email from the Professors' account to
