Lenticular Photo Processor is an application program that is designed to take the frame sets obtained by the Lenticular Photo Capture program and prepare them for printing. The program has a very intuitive graphical interface that can be accessed by just one-click. You can easily select the alignment mode for the frames (X and Y only, or both axes and rotation). When your frames align correctly, the program will automatically generate an alignment file, which will be used to correct all the frame sets to be printed. You can also select between the following three methods to get your frames to print: pitch (from 6 to 30 lpi or lines per inch), size (magnification), and crop. You can also choose the final size of the finished photo. The software also features a nice set of export options. You can save the photos in a.bmp format, a.jpeg format, or a.tif format. You can also save the images as a.tif file that will be outputted with it's original size. The results generated by the program are quite satisfactory. It provides a very simple way to create the frames that you have captured and extract the frames to print. Looking for free tech support?
